Mental Health Analysis Model

1. Model Description:

The dataset used for the model is named "Mental Health Dataset" and focuses on individuals' mental health. It was collected through a survey aiming to understand the factors affecting mental health and determine whether individuals have received psychological treatment and the importance of the model lies in early detection of mental health issues and bridging the gap in mental health support and reducing bias and stigma around it.

2. Goals of the Model:

- Identify factors impacting mental health.
- Predict the likelihood of receiving psychological treatment.
- Analyze trends across different demographic groups.
- Evaluate the impact of the work environment on mental health
- Raise awareness about mental health issues.

Dataset Used:

Jikadara, B. (n.d.). <https://www.kaggle.com/datasets/bhavikjikadara/mental-health-dataset>.
